

CMOS Quad Bilateral Switch

FEATURES

- Wide Operating Voltage Range of 3.0V to 18.0V
- Maximum Input Current of 1µA at 18V over Full Package-Temperature range, 100nA at 18V and 25°C
- · Standardized Symmetrical Output Characteristics
- Noise Margin

1.0V min @ 5.0V supply

2.0V min @ 10.0V supply

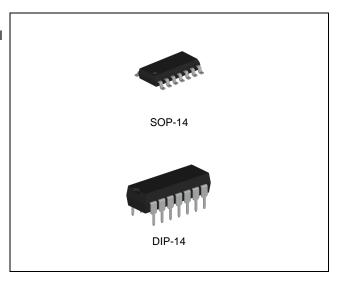

2.5V min @ 15.0V supply

The CD4066B device is a quad bilateral switch intended for the transmission or multiplexing of analog or digital signals. In addition, the on-state resistance is relatively constant over the full signal input range.

The CD4066B device consists of four bilateral switches, each with independent controls. Both the p and the n devices in a given switch are biased on or off switch is tied to either the input (when the switch is on) or to $V_{\rm SS}$ (when the switch is off). This configuration eliminates the variation of the switch-transistor threshold voltage with input signal and, thus, keeps the on-state resistance low over the full operating-signal range.

The advantages over single-channel switches include peak input-signal voltage swings equal to the full supply voltage and more constant on-state impedance over the input-signal range.

Note1. Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
